

Learner and Opportunity Performance Analysis

Executive Summary

This analysis examines learner applications and internship opportunities to understand participation, scholarship access, rewards, completion, and application patterns. The dataset contains 5,730 learners, 10 opportunities, 9044 applications, 8108 scholarships, and 731 rewards, providing a basis for assessing learner engagement and program outcomes.

1. Project Overview and Objectives

- Measure learner participation
- Evaluate scholarship access
- Analyze reward distribution
- Identify application trends over time
- Identify areas of improvement

2. Data Preparation and Methodology

Data that had been cleaned in week 2 was used for this analysis. Key metrics were calculated for learners, opportunities, applications, scholarships, rewards, and completion. The data was then exported to Google Sheets and connected to Looker Studio, where scorecards, charts, and trend visualizations were used to present the findings in an interactive dashboard.

3. Main Analysis and Results

3.1. Overall Performance

The program recorded 5,730 learners, 9044 applications, and 10 opportunities. A total of 8,108 scholarships and 731 rewards were recorded, indicating strong learner participation and substantial program support. Overall, the data provides a positive view of program reach while highlighting differences in engagement and completion across opportunities.

	metric text	value bigint
1	Total Rewards	731
2	Total scholarships	8108
3	Total Learners	5730
4	Total Opportuniti...	10
5	Total Applications	9044

3.2. Opportunity Performance

The chart below shows the sign-up count grouped by the categories of opportunities. Internship had the highest sign-ups while Program, and Xploreu had the lowest. We were able to see that Internship opportunities attracted the

highest number of sign-ups, while Program and Xploreu had the lowest, indicating differences in learner demand across opportunity categories.

This chart shows the rate of completion by category. Xploreu and Program had the highest completion rates compared to the previous chart. This comparison shows how completion rates can be influenced by small sample sizes, with Xploreu and Program reaching 50% because only one of their two sign-ups completed.

The chart below shows how the completion count compares to the duration of the opportunity. One-month duration had the highest completion counts followed by two-month duration. This comparison helps show whether opportunity duration is associated with higher completion levels and can inform decisions about optimal program length.

3.3. Application Trends

This chart shows the number of applications over the last seven dates. The applications decreased over the month of April, 2026, with two days (18th, and 19th) having zero applications. This chart useful for identifying short-term changes in application activity.

The bar chart below shows the application counts over the last 6 months starting from November to April. December had the highest number of applicants while March had the lowest. This comparison is important because it highlights changes in learner demand over time and helps identify periods of high and low engagement.

This stacked chart shows learner status over the last 6 months. It was noted that even though April had a higher number of applicants compared to March, it had the lowest number of team allocation. This is important as we try to find out possible reasons why the number of applicants keeps decreasing.

3.4. Scholarship and Lead Source Analysis

3.5. Quarterly Comparison

For the quarterly analysis, learner applications were used to identify changes in engagement over time. The comparison shows that there was a 31.53 percent decrease between the last quarter of 2025 and the first quarter of 2026. This helps to identify seasonal patterns and changes in learner participation.

4. Findings

4.1 Strong overall learner participation:

The program recorded **5,730 learners, 9,044 applications, 10 opportunities, 8,108 scholarships, and 731 rewards**, indicating substantial learner engagement and program reach.

4.2 Internship opportunities attracted the most learners:

Among the opportunity categories, **Internship** had the highest number of sign-ups, while **Program and Xploreu** had the lowest. This shows that learner demand varies considerably across opportunity types.

4.3 Completion rates differed across categories:

Xploreu and Program showed the highest completion rates at **50%**, but these percentages were influenced by their small sample size—only one out of two sign-ups completed in each category.

4.4 Shorter opportunities showed stronger completion counts:

Opportunities with a **one-month duration** had the **highest completion counts**, followed by two-month opportunities. This suggests that shorter program durations may be associated with better completion levels.

4.5 Recent application activity showed a decline:

Applications decreased during April 2026, with **zero applications recorded on April 18 and April 19**.

4.6 Monthly application trends fluctuated:

Over the six-month period from November 2025 to April 2026, **December recorded the highest number of applicants, while March recorded the lowest**.

4.7 Applicant-to-team allocation needs attention:

Although April had more applicants than March, it recorded the **lowest number of team allocations**, suggesting a possible gap between applications and successful allocation.

4.8 Quarterly participation declined significantly:

Applications decreased from **720 in Q4 2025 to 493 in Q1 2026**, representing a **31.53% decrease**.

4.9 Lead sources provide useful acquisition insights:

The dashboard tracks sources such as **Social Media, Illinois Institute of Technology, GlobalShala Website, Saint Louis University, Google Search, and referrals**, allowing the program to identify where applicants are coming from.

4.10 Scholarships and rewards were distributed across multiple categories:

The dashboard provides a category-wise view of scholarship distribution and reward counts, making it possible to compare program support across opportunity types.

5. Recommendations

5.1 Increase promotion of low-performing opportunity categories: Since Internship opportunities have the highest sign-ups while Program and Xploreu have much lower participation, targeted promotion can be used to improve awareness of less popular categories.

5.2 Focus on improving application conversion: The difference between applicants and team allocations, particularly in April, should be investigated to understand why applications are not converting into allocations.

5.3 Strengthen learner engagement during low-activity periods: The decline in applications during April and the zero-application days on April 18 and 19 suggest that additional campaigns, reminders, or promotional activities could help maintain consistent application activity.

5.4 Analyze and strengthen high-performing lead sources: The organization should identify which sources generate the most applications and focus marketing efforts on the most effective channels.

5.5 Promote opportunities with manageable durations: Since one-month opportunities recorded the highest completion counts, shorter opportunities could be considered when designing or restructuring programs.

5.6 Investigate the quarterly decline: The **31.53% decrease** from Q4 2025 to Q1 2026 should be investigated to identify whether it is related to seasonal demand, reduced promotion, opportunity availability, or other factors.

5.7 Use completion rates carefully: Categories such as Xploreu and Program show a 50% completion rate, but the small number of participants means these percentages should not automatically be interpreted as strong performance.

5.8 Use dashboard monitoring regularly: The dashboard should be reviewed periodically to monitor applications, completion, team allocation, scholarships, rewards, and lead sources and identify changes early.

6. Dashboard Design Explanation

The data was first **sorted and organized using PostgreSQL** to prepare it for analysis. The processed data was then connected to **Looker Studio**, where visual graphics such as scorecards, bar charts, and trend charts were created.

The dashboard mainly includes:

- **KPI scorecards** for learners, applications, scholarships, rewards, and opportunities.
- **Opportunity charts** to compare sign-ups and completion rates. The Learner Completion Count vs Duration chart contains a duration of up to two years therefore a slide filter was included make it possible to single out a specific duration.
- **Application trend charts** to show changes over time. A dropdown filter was included in the Application Status charts so that it is possible to view how individual status compares in the last 6 months.
- **Lead source and scholarship charts** to understand application sources and distribution.
- **Quarterly comparison** to identify changes in applications.

Overall, the dashboard converts the data processed through PostgreSQL into **simple visual graphics in Looker Studio**, making the findings easier to understand and analyze.

Conclusion

The analysis provides a clear overview of **learner participation, opportunity performance, applications, scholarships, and rewards**. The dashboard makes these trends easier to understand through visualizations, while the **31.53% decline in applications** highlights the need for stronger learner engagement and targeted promotion. Overall, the findings can help improve opportunity planning, outreach, and learner participation.
